A; Experimental source: liver
C; Comment: The amino-terminal 600 residues exhibits homology with those of inter-alpha the c; Comment: The amino-terminal 600 residues exhibits homology with those of inter-alpha the c; Function:
A; Description: highly sensitive to plasma kallikrein
C; Superfamily: inter-alpha-trypsin inhibitor complex component II
C; Keywords: chondrolin sulfate proteoglycan; glycoprotein; serine proteinase inhibitor
F; 1-28/Domain: signal sequence #status predicted <SIG>F; 29-68/Product: inter-alpha trypsin inhibitor heavy chain-related protein #status predicted
F; 81, 207, 577/Binding site: carbohydrate (Asn) (covalent) #status predicted
F; 66/Bainding site: carbohydrate (Ser) (covalent) #status predicted
F; 656, 702/Binding site: carbohydrate (Ser) (covalent) #status predicted
F; 701/Binding site: carbohydrate (Thr) (covalent) #status predicted

T "Identification of disulfide bonds in the ninth component (C9) of
T human complement.";
FEBS Lett. 380:8-12(1996).

-!- FUNCTION: C9 is the final component of the complement system to be added in the assembly of the membrane attack complex. It is able to enter lipid bilayers, forming transmembrane channels.

-!- FTM: Thrombin cleaves factor C9 to produce C9a and C9b.
-!- PTM: Thrombin cleaves factor C9 to produce C9a and C9b.
-!- DISABSE: Defects in C9 are a cause of component C9 deficiency c C9D) [MIM:120940]. Patients with C9D suffer from recurrent bacterial infections, predominantly from Neisseria meningitidis.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 LDB-receptor class A domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "Localization and molecular modelling of the membrane-inserted domain of the ninth component of human complement and perforin."; Mol. A Tomlinson S., Wang Y., Ueda E., Esser A.F.;

Sequence in horse C9 responsible for restriction of hemolysis.";

J. Immunol. 155:43-444(1955).

C -!- FUNCTION: C9 is the final component of the complement system to be added in the assembly of the membrane attack complex. It is able.

C -!- FUNCTION: C9 is the final component of the complement complex.

C -!- FUNCTION: Secreted.

C -!- FTM: Thrombin cleaves factor C9 to produce C9a and C9b.

C -!- FTM: Thrombin cleaves factor C9 to produce C9c and C9b.

C -!- FTM: Thrombin cleaves factor C9 to produce C9c and C9b.

C -!- SIMILARITY: Contains 1 EGF-like domain.

C -!- SIMILARITY: Contains 1 LSP type-1 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. T. Chimeras of human complement C9 reveal the site recognized by complement regulatory protein CD59.";

T. Complement regulatory protein CD59.";

J. Biol. Chem. 270.3483-3486(1995).

C. -- FUNCTION: C9 is the final component of the complement system to b added in the assembly of the membrane attack complex. It is able to enter lipid abliayers, forming transmembrane channels.

C. -- SUNCELULAR LOCATION: Secrete C9 to produce C9a and C9b.

-- FTM: Thrombin cleaves factor C9 to produce C9a and C9b.

-- FTM: Thrombin cleaves factor C9 to produce C9 and C9b.

-- FTM: Thrombin cleaves factor C9 to produce C9 and C9b.

-- SIMILARITY: Contains 1 EGF-like domain.

-- SIMILARITY: Contains 1 LDL-receptor class A domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The fission yeast print ligase.";

Bachem. Biophys. Res. Commun. 317:1138-1143(2004).

The fission yeast print ligase protein involved in mRNA export. Es ubiquitin ligase protein involved in mRNA export from the nucleus by regulating the transport of hnRNP proteins such as rael.

The ATHWAY: Ubiquitin conjugation; third step.

SUBJECTIVILAR LOCATION: Nuclear.

SIMILARITY: Belongs to the TOMI/PTR1 family.

SIMILARITY: Contains 1 HECT-type E3 ubiquitin-protein ligase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Asp-rich.

Sims PJ;

WPI; 1999-527301/44.

Compounds modulating CD59 mediated complement activity, for treatment of, e.g. immunovasculitis.

Example 2; Page 36; 75pp; English.

activity. It provides (i) molecules structurally mimicking human CD59 amino acid residues 42-58 (region which serves as binding site for CD59 - C9 interactions) when they are in a spatial orientation which can inhibit the formation of the human C59-5 complex. These mimetics specifically bind to amino acid residues 359-384 of human C9. (ii) molecules structurally mimicking C9 amino acids 359-384 when they are in a spatial orientation which can promote the formation of the C5b-9 complex. Compounds that mimic CD59 can be used to increase CD59 inhibition of C5b-9 complex assembly. This is especially useful in patients in need of suppression of complement-mediated inflammation, e.g. immune disorders and diseases such as immunovasculitis, rheumatoid arthritis, scleroderma. The invention relates to compounds modulating CD59 mediated complement

(ii) molecules structurally mimicking C9 amino acids 359-384 when they are in a spatial orientation which can promote the formation of the C5b-9 complex. Compounds that mimic CD59 can be used to increase CD59 inhibition of C5b-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compounds modulating CD59 mediated complement activity, for treatment of, e.g. immunovasculitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9 complex assembly. This is especially useful in patients in need of suppression of complement-mediated inflammation, e.g. immune disorders and diseases such as immunovasculitis, rheumatoid arthritis, scleroderma. Compounds that mimic C9 can be used to promote C5b-9 complex assembly. This is useful in patients in need of complement activation. The composition can be administered as an adjunct to tumour therapy. The present sequence represents a human C9 protein fragment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polypeptide with human immune response associated protein (IRAP) activity. Further disclosed are polymucleotides encoding the polypeptides of the invention. The polypeptides, polymucleotides, composition, and methods are useful in diagnosing, treating, or preventing immune system, neurological, developmental, muscle, or cell proliferative disorders, disorders of lipid metabolism, obesity, and breast, colon, lung, ovarian, or prostate cancer. The current sequence represents a human immune response associated protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or preventing obesity, cancer, immune system, neurological, developmental, muscle, or cell proliferative disorders, or disorders of lipid metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New immune response associated protein, useful in diagnosing, treating,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

18-NOV-2004

ABM83943;

ABM83943 standard; protein; 522 AA.

```
The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A proposed from one of the 2722 sequences defined in the specification. A proposed from one of the invention may have a use in game therappy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infloring infloring infloring infloring infloring from minute biological samples, in detecting single nuclectide polymorphisms, as molecular weight markers, and for somatic or germline from minute biological samples, in detecting single nuclectide olymorphisms, as molecular weight markers, and for somatic or germline consent the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosting a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

Claim 27; Page; 190pp; English.

```
The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conclusions may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 140; DB 8; Length 522; 100.0%; Pred. activity. It provides (1) molecules structurally minicking human CD59 amino acid residues 42-58 (region which serves as binding site for CD59 constructations) when they are in a spatial orientation which can inhibit the formation of the human C5b-9 complex. These minetics specifically bind to amino acid residues 359-384 of human C9. (ii) molecules cructurally minicking C9 amino acids 359-384 when they are in a spatial orientation which can promote the formation of the C5b-9 complex. Compounds that minic CD59 can be used to increase CD59 inhibition of C5b-0 complex assembly. This is especially useful in patients in need of suppression of complex assembly. The is especially useful in patients in need of suppression of compounds that minic C9 can be used to promote C5b-9 complex assembly. The first is encourabled inflammation, e.g. immune disorders and diseases such as immunovascultis, rheumatoid arthritis, scleroderma. Compounds that minic C9 can be used to promote C5b-9 complex assembly. The composition can be administered as an adjunct to tumour therapy. The present sequence represents a rabbit C9 protein fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Compounds modulating CD59 mediated complement activity, for treatment of, e.g. immunovasculitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense; prokaryotic essential gene; cell proliferation; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amino acid residues 359-384 of human complement C9 are critical for binding CD59 to C9, resulting in inhibition of C5b-9 complex assembly. Peptides that mimic this human C9-derived peptides sequence, and antibodies raised against such peptides, can be used to modulate binding of CD59 to C9. The peptides bind to endogenous CD59 to prevent the CD59 complement-mediated activation of cells. Inhibition of CD59 is useful as an adjuvant for tumour therapy and as a contraceptive. The antibodies finhibit assembly of the C5b-9 complex, by binding to C9. This is useful complement-mediated cytolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulating binding of CD59 to C9 complement component - uses agent mimics or binds the C9-specific motif, used to activate complement tumour therapy or to treat complement mediated inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                         the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The autisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for eligential proliferation of an organism. The acididate molecules for rational acids and dentifying proteins or screening for promoted acids are useful for dentifying proteins or screening for homologous nucleic acids required for profice and defented molecules for rational

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A polypeptide (AAW18311) comprises rabbit complement C9. Chimeric proteins were constructed in which the segment of C9 corresponding to the putative CD59 binding site were interchanged between rabbit and human C9 (see also AAW18310). These were tested for haemolytic activity and for sensitivity to inhibition by membrane CD59. Substn. of human C9 residues 334-415 into rabbit C9 resulted in a protein that was indistinguishable from human C9 in its sensitivity to inhibition by CD59. When this same segment of human C9 was replaced by the corresponding rabbit sequence (aa339-424), the chimera was indistinguishable from rabbit C9 and was virtually unaffected by the presence of membrane CD59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modulating binding of CD59 to C9 complement component - uses agent mimics or binds the C9-specific motif, used to activate complement tumour therapy or to treat complement mediated inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   d
                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid concluding a promoter operably linked to the nucleic acid concluding a properties of sexpression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding colliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that has an activitie cellular proliferation or the biological pathway in which a proliferation-required gene product or that has an activity against a biological pathway in which a proliferation-required gene product or that has an activitie of pathway in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the extent conspound's activity; (11) a culture comprising strains in which the extent consponency of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required conformant or proliferation of an organism. The antisense modeled acids required conformant proversers and addent modeled acids are useful for an addentifying processed or the screening for homologous nucleic acids required conformant proversers and acids are useful for an addentifying processed or the screening for manufacturing and acconfident modeled acids required for confident modeled acconfident modeled acconfident modeled acconfident mod
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a DNA which encodes a novel polypeptide. A vector containing the DNA is useful as a reagent in estimation of standard substance. The antibody is useful for detecting the vector containing the DNA and for screening substances and compounds that interact specifically with the vector containing the DNA. The vector containing the DNA is used as a pharmaceutical, in treatment or as preventive agent with respect to disease e.g., brain diseases preferably mental disorders. The present sequence represents the amino acid sequence of a novel human polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                          New DNA derived from KG-1 cDNA library and encoded polypeptide, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Zyskind JW;

                                                                                  ö
                             New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                            drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-Sequence represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                useful as molecular targets for diagnostics, prophylaxis and treatment of
pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs,
                                                                                                                                                                                                                                         Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   34.6%; Score 48.5; DB 7; Length 417; 35.3%; Pred. The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences conciding at least 8 amino acids of any of the 6888 amino acid sequences (ally defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially—adversable set of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule compensable set of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality, a single exon microarray for measuring human gene expression, a method of contiguous amino acids of any of the above—mentioned amino acids or ontiguous amino acids of any of the above—mentioned amino acids or probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above—mentioned amino acids or contiguous amino acids of any of the above—mentioned amino acids or contiguous amino acids of any of the above—mentionally are probes or microarrays to sequence (optionally with conservative amino acids substitutions), and a computer-readable methods of selling and/or licensing single exon probes or microarrays to the probes methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expression of a single exon probe cited above. The probes may be used as tools for surveying tissues to detect the presence of expression of a single exon microarray. The probes are used in in detecting and characterising grow alterations in the genomic locus that includes their exon, or in const
                                      New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Staphylococcus epidermidis; open reading frame; ORF; bacterial infection; antibacterial; gene therapy.

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                  Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT PILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 5
807574
malate dehydrogenase (EC 1.1.1.37) - Phenylobacterium immobile (fragment)
C.Species: Phenylobacterium immobile
C.Date: 07-Sep-1990 #sequence_revision 07-Sep-1990 #text_change 09-Jul-2004
C.Accession: 807574
B.R. And T.O.; Hund, H.K.; Speth, A.R.; Lingens, F.
B.R. Romen Hoppe-Seyler 370, 763-768, 1989
A.Title: Purification and N-terminal amino-acid sequences of bacterial malate dehydrogen A; Reference number: 804956; MUID:89374824; PMID:2775496
A; Rocession: 807574
A; Molecule type: protein
A; Residues: 1.25 xROM>
A; Accession: 80757
A; Molecule type: Unit Residues (MUID:89374824; PMID:2775496
C; Reywords: oxidoreductase; tricarboxylic acid cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tibosomal protein L30 - Nocardia asteroides (fragment)

Cispecies: Nocardia asteroides

Cispecies: No-Mar-1994 #sequence_revision 28-Oct-1994 #text_change 09-Jul-2004

Cipacession: JP0066

R;Ochi, K.

Bubmitted to JIPID, February 1994

A;Description: Phylogenetic diversity in the genus Bacillus and comparative ribosomal profession: JP0042

A;Accession: JP0066

$571864
glutathione transferase (EC 2.5.1.18) class alpha 6a - pig (fragment)
NiAlternate names: glutathione 5-transferase class alpha 6a
C;Species: Sus scrofa domestica (domestic pig)
C;Species: Sus scrofa domestica (domestic pig)
C;Accession: $71864

A;Title: Characterization of pig liver glutathione 5-transferases using HPLC-electrospra
A;Reference number: $71864; MUID:96332484; PMID:8760377
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A.Cross-references: UNIPROT: 07M3E7
A.Experimental source: liver; cytosolic
C.Comment. At least five species-independent classes of cytosolic glutathion transferase
mitochondrial form are known.
C.Complex: dimer
C.Function:
A.Description: catalyzes the nucleophilic conjugation of intracellular glutathione to a
A.Pathway: detoxification; xenobiotics metabolism
A.Note: increased hydrophilicity of GSH-conjugates facilitates their further metabolism
                             A;Residues: 1-20 <STR>
A;Cross-references: UNIPROT:Q7M484
C;Comment: This protein, a small, water-soluble apolipoprotein, is thought to increase ts a residual pathway for flight-related lipid transport.
C;Keywords: hemolymph; lipid transport

Probably provides the glutamate and tyrosine residues that are cross-linked and modified to form the coenzyme (By similarity).
-i- PATHWAY: Pyrroloquinoline quinone (PQQ) biosynthesis.
-i- SIMILARITY: Belongs to the pqqA family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                             Gluconobacter oxydans (Gluconobacter suboxydans).
